WEDE5020 POE Part 3 - Enhancements & SEO

1. Feedback Corrections & Changelog

- **Navigation & Mobile Layout:** Adjusted padding and font sizes across mobile views to ensure touch targets pass tap-size checks.
- **Form Validation:** Added client-side JavaScript validation to check required fields and email formatting on enquiry.html and contact.html.
- **Accessibility:** Linked all form <label> tags directly to input IDs and added clear alt tags to every image asset.

2. SEO Discussion

Q1: What is SEO and its purpose in web development?

Search Engine Optimization (SEO) is the practice of structuring website content and code so search engines like Google can easily crawl, index, and rank web pages. Its primary purpose in web development is to increase organic visibility, bringing relevant visitors to a site without paying for advertisement space.

Q2: How SEO practices improve User Experience (UX) and site performance

SEO relies heavily on technical performance and clean structural design. Optimizing images and minifying script files speeds up site loading times, while logical heading structures help users navigate content smoothly. Search engines rank fast, accessible, and structured sites higher because they offer a better experience for human visitors.

Q3: Key benefits of implementing SEO on a website

Implementing SEO improves search engine ranking positions and builds long-term authority and credibility for a brand. It guarantees that users searching for specific services find accurate information quickly. Additionally, SEO produces sustained organic traffic over time compared to temporary paid promotional campaigns.

Q4: Demonstrating SEO techniques in HTML, CSS, and JavaScript

- **HTML:** Semantic tags (<header>, <nav>, <main>, <footer>) and alt text (<img src="dog.jpg" alt="Rescued golden retriever">) help search crawlers understand page content context.
- **CSS:** Using clean, responsive media queries ensures mobile-friendliness, which is a major Google ranking factor.

- **JavaScript:** Scripts are deferred (<script src="script.js" defer></script>) so that initial page rendering and indexing are not delayed by heavy code logic.

Q5: Purpose of HTML meta elements with examples

Meta elements reside inside the <head> tag to provide search engines and browsers with metadata about the webpage. They set the page character set, responsive viewport settings, and display descriptions on search result pages.
Examples:

```
<meta charset="UTF-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Hope Haven Shelter provides animal
rescue, pet adoption services, and community care programs.">
```

3. Web Deployment Instructions

The complete website project can be uploaded directly to **Netlify** or **GitHub Pages**:

1. Push all project files (index.html, about.html, services.html, enquiry.html, contact.html, script.js, robots.txt, sitemap.xml, and README.md) into your GitHub repo.
2. In GitHub, open **Settings** > **Pages**, select the main branch, and click **Save**.
